

Experience the benefits of soft water with the efficiency of The Windsor Series

Windsor Series shown in 24,000, 32,000, and 48,000 capacities with optional tank jackets.

## The Windsor Series

### Features:

- ◆ Demand initiated regeneration with variable reserve capacity automatically adjusts to your family's changing water use and regenerates only as needed.
- ◆ Double backwash insures maximum regeneration efficiency.
- ◆ Easily adjustable regeneration cycle times for water conservation.
- ◆ Adjustable for a variety of water treatment conditions including settings for hardness, capacity, and time of regeneration.
- ◆ Digital display for time of day and gallons remaining.
- ◆ Advanced electronics with history and diagnostics features for:
  - Days since last regeneration
  - Gallons since last regeneration
  - Current flow rate
  - 7 day peak flow rate
  - 7 day reserve capacity history
  - 63 day water use history
- ◆ All memory is permanently retained in the event of a power outage with no reprogramming and no battery back-up required.

# Only the Best Water Gets Past the Iron Curtain.

The Iron Curtain™ Filtration System is among the simplest, most economical and effective iron filters available. It removes iron, sulfur, and manganese from water.

The reason your water can taste, look and smell so bad is the incredibly high concentrations of dissolved minerals. You can't see or feel them, but they're there! And you can sure smell and taste them.

Your iron water passes through an aeration tank which converts dissolved minerals such as iron, manganese, and sulfur into physical particles. These particles continue circulating in the tank long enough to grow to a size where they can be trapped in the filter. The Iron Curtain Filtration system then removes these minerals . . . leaving clean, good smelling, good tasting water.

The Iron Curtain is the best solution the industry has to offer. It's unique operation reduces costs and maintenance while delivering years of trouble-free service.

## How does an Iron Curtain work?

1. Mineral-rich water is forced through an aeration tank ① which converts dissolved minerals such as iron, manganese and sulfur into physical particles.
2. These tiny mineral particles then circulate in the system for enough time to grow to a size where they are trapped in the filter tank. ② This way, the highest level of dissolved minerals can be easily removed from your water.
